INSIGHTS & STORYTELLING - COUNTRY SEGMENTATION ANALYSIS

Income vs Life Expectancy

Countries with higher income generally show higher life expectancy. Wealth enables better healthcare, nutrition, and living conditions. Key insight: economic growth improves longevity.

Child Mortality vs Income

There is a strong negative relationship between income and child mortality. Low income countries suffer higher child deaths due to poor healthcare access.

Health Expenditure vs Child Mortality

Higher health spending reduces child mortality significantly. Investment in healthcare systems directly improves survival rates.

GDP vs Fertility Rate

Low GDP countries show high fertility rates, while developed countries show low fertility rates due to education and awareness.

Inflation vs Economic Stability

High inflation reduces purchasing power and negatively affects economic stability and GDP growth.

Segment Insights

Developed nations have high income and low mortality. Emerging economies are improving. High-risk countries show poor health and economic indicators.

High-Risk Pattern

Countries with income < 5000 and child mortality > 80 fall into high-risk category and require urgent aid.

Correlation Insights

Income and life expectancy are positively correlated. Child mortality is negatively correlated with income. GDP strongly influences health outcomes.

Final Business Insight

Economic inequality drives health inequality. Targeted aid is required for low-income, high-mortality countries to improve global development balance.
